

# Instamax

Dedicated to Maxime, to help keep her memory alive.

## How it works

Open [instamax.html](#) using your preferred browser (it should work on all modern browsers).

NOTE: If you see the following text, go to the [Setup](#) section.

There doesn't seem to be anything here.  
Have you run the converter?

There are 3 buttons at the top:

-  always brings you back to the initial overview page.
-  is used to sort by upload date (newest or oldest first).
-  or  is used for switching the theme (dark or light). This automatically tries to match with your computer's theme.

You can scroll through the overview, more posts will be loaded as you scroll down.

Once you scroll down a bit, a button will appear in the bottom right corner that will bring you back to the top of the page.

## Posts

Clicking a photo or video opens that post.

- Posts marked with a  icon consist of multiple photos and/or videos.

## Navigation

Posts can be directly navigated using the < or > buttons, or by using the left and right arrow keys on your keyboard.

They can be closed by clicking the , hitting [Escape](#) on your keyboard, or clicking outside the post.

## Content

Videos can be paused by clicking on them.

- If they have sound it will be automatically muted, but can unmuted by clicking the  button in the bottom right corner of the video.

Descriptions can be scrolled through if they are long enough. The same goes for posts consisting of multiple photos or videos.

- Tags in descriptions can be clicked to view all posts with that tag.

## Setup

Just in case it becomes necessary, here are the steps needed to convert and move all the photos and videos to their proper place so that everything works.

### Windows

1. Have all the photos and videos, as well as the `csv/Excel` file that contains all the post information in the same folder as this (the `instamax` location).
2. Run the `converter.exe` program in the `scripts` folder.

### Mac / Linux

1. Same as step 1 on Windows.
2. Open a terminal window.
  - !! Change the working directory to this location (the `instamax` location).
3. Run this command: `python -m scripts\converter.py`

If everything worked as it should, there should be a `data` folder containing an `images` folder (which houses all the photos) and a `videos` folder (which houses all the videos). The `csv/Excel` file should have been moved to the `data` folder as well, and there should also be a `posts-info.js` file now.

## Updates

If there are ever any issues or errors or things that you want to have changed or added, you can contact me at [janvanoverwalle@gmail.com](mailto:janvanoverwalle@gmail.com).

There are 2 scripts included that can download the latest version of Instamax (if there are any changes). This way it is possible for me to fix or improve anything in the future with as little hassle as possible for you.

- `updater.bat` is for Windows.
- `updater.sh` is for Mac / Linux.

## Backup

Should you ever need or want it, a complete backup version of Instamax can be downloaded [here](#) or by scanning the QR code:
